## GEOPHYSICAL SURVEY REPORT

SITE NAME	[redacted] Cemetery
HUNTER GEOPHYSICS SITE CODE	2014/7
CLIENT	[redacted] Cemetery Trust
SURVEYORS	David Hunter, Shannon Hunter
SURVEY DATES	27-29 November, 2014
REPORT SUBMISSION DATE	24th January, 2015
REPORT AUTHOR	David Hunter
HERITAGE VICTORIA ARCHAEOLOGY REPORT NUMBER	[redacted]

### Copyright notice

Unless otherwise noted, all text, data and images shown herein are copyright Hunter Geophysics. This report may be distributed freely by the client on the provision that no changes are made to any part of the report, and that Hunter Geophysics are attributed authorship of the report. This notice does not override the copyright restrictions pertaining to materials within this document for which Hunter Geophysics does not hold copyright; any entity sharing this document should adhere to all relevant copyright restrictions, not only Hunter Geophysics' restrictions.

### Statement of indemnity

The results and interpretation of the geophysical surveys described herein should not be considered an absolute representation of the underlying soil or archaeological features, but instead as a hypothesis yet to be verified. Confirmation of geophysical interpretations is only possible through careful (preferably archaeological) excavation. Every effort is made to ensure that these risks are minimized, but Hunter Geophysics does not guarantee that the interpretations of geophysical data provided herein are accurate.

While Hunter Geophysics aims to produce accurate interpretations of geophysical surveys, numerous unforeseeable issues may arise that may limit the accuracy of interpretations. These may include unforeseen soil or geological conditions, the presence of rabbit or other animal burrowing, the presence of tree/plant root systems, ploughing, site drainage and interference caused by variations in the Earth's magnetosphere and ionosphere, or interference caused by nearby radio transmitters or solar weather.

Of particular importance is the similar appearance of tree roots and rabbit burrowing with unmarked graves. These factors are expected to have influenced the geophysical data described in this report; areas noted in the 'Results' section and associated figures as indicative of such features should be treated as if they were unmarked graves due to this uncertainty.

Other areas of unknown soil disturbance may be noted in the report. These areas generally do not exhibit the same characteristics as unmarked graves; however, it is possible that these areas actually contain multiple burials, at different depths and on different alignments, which may obscure the graves. Therefore, these areas should also be treated as if they are unmarked graves.

Important notice: the precision of the location of detected features within all survey areas is within 0.2 metres.

This survey was specifically designed for the detection of unmarked graves. The location or nature of any other detected buried feature, especially buried utilities, cannot be guaranteed. The client is advised to employ a buried utility/pipe/cable locator should they require the precise mapping of buried utilities (especially prior to any excavation the client may undertake). Hunter Geophysics can provide this service if required under a separate contract.

Please note that the interpretations of geophysical data in areas subjected to the "scanning" method (the locations of which are noted in the GIS data in the accompanying USB memory stick) may be erroneous due to the experimental nature of this method. Hunter Geophysics cannot guarantee that all unmarked graves in these areas have been detected; archaeological test excavations of these areas is recommended.

## Executive summary

An intensive geophysical survey was undertaken by Hunter Geophysics at the [redacted] Cemetery for the purposes of locating unmarked graves. The geophysical investigation has determined the location of numerous unmarked graves.

## Introduction

Hunter Geophysics were commissioned by the [redacted] Cemetery Trust to undertake a geophysical survey covering specific areas at the [redacted] Cemetery, [redacted], Victoria.

## Aims

The geophysical survey was requested to determine the location of any unmarked graves within specified survey areas at the [redacted] Cemetery.

## Geography and topography

The [redacted] Cemetery is located on the north side of Cemetery Road, [redacted], Victoria. The cemetery is situated on the slope of a volcano; topographic corrections of geophysical data were required due to the highly undulating terrain.

## Site geology

Please refer to the geological map on page 5. The [redacted] Cemetery is located on the southwestern slopes of Mount [redacted], a scoria cone volcano. The site is shown on the geological map as being on Newer Quarternary Volcanics. The local bedrock is likely composed of basalt and scoria basalts, with “floating” boulders possibly suspended within the soil matrix. The site features an iron-rich loam soil.

**Image removed from  
report to protect the  
site's location.**

Figure 1: an aerial photograph (courtesy of Google, Inc.) showing the [redacted] Cemetery, to the north of Cemetery Road, [redacted], Victoria.

### Site weather conditions

The geophysical survey was conducted on 27-29 November, 2014. The Bureau of Meteorology records the following weather data for [redacted], a nearby town considered indicative of weather at the site:

Date	Minimum temperature (°C)	Maximum temperature (°C)	Rainfall (mm)
27th November	6.6	19.8	0
28th November	7.0	24.4	0
29th November	8.5	29.2	0

While no mosaic errors are expected to occur in geophysical data, survey areas were processed and interpreted individually rather than as a whole in order to prevent any degradation in data due to variations in soil moisture due to weather.

**Image removed from  
report to protect the  
site's location.**

## Methodology

### Data collection

The client requested specific areas to be covered by the geophysical survey (as seen in figure 4).

The majority of the site was covered by high-resolution “survey grids”. Due to financial constraints, the remaining areas were subjected to a lower-resolution “scanning” methodology, which allowed for faster prospection of unmarked graves and an evaluation of the suitability of these areas for future high-resolution survey.

#### Methodology - survey grids

Ground-penetrating radar (GPR) data were collected by Hunter Geophysics using a Sensors and Software Noggin Utility SmartCart system and a Noggin antenna with a central transmitting frequency of 250MHz. Survey areas were staked-out using a Topcon GR-3 RTK GNSS receiver and/or a [redacted] robotic total station; both the RTK GNSS receiver and the robotic total station were used to collect geographic data pertaining to every fourth ground-penetrating radar trace (i.e. latitude, longitude and elevation values were collected for every fourth geophysical measurement) where sufficient satellite coverage or line-of-sight was possible.

All survey traverses were staked-out using brick-layers string to ensure complete survey grid coverage. Traverses were spaced at 25cm intervals, with each GPR trace being recorded at 5cm intervals along each traverse. Each GPR trace was recorded with a time-window of 98 nanoseconds.

Data were collected automatically by a computer using an odometer wheel calibrated at the beginning of the survey. In this manner, GPR traces are recorded autonomously as the surveyor pushes the GPR system along the traverse. The data were stored in an internal data logger and downloaded to a field computer via the system’s memory card.

#### Methodology - scanning areas

Areas subjected to the prospection-level scanning methodology were also surveyed using ground-penetrating radar. However, due to financial constraints, the radargrams from this area were interpreted on-the-fly (during data collection); substantial hyperbolic responses in the radargrams were assumed to be indicative of unmarked graves. The location of these responses were then mapped using the RTK GNSS receiver and entered into the cemetery map.

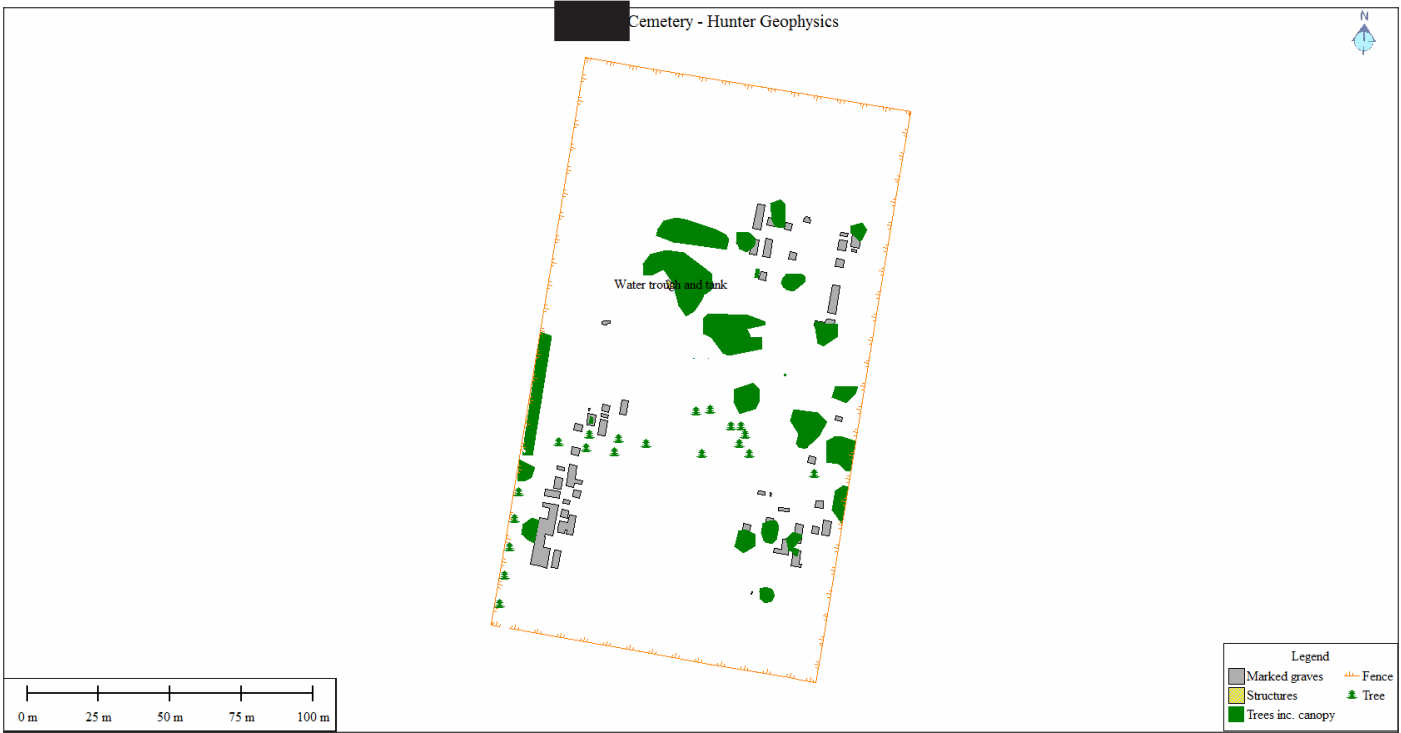

Figure 3: a map of the [redacted] Cemetery.

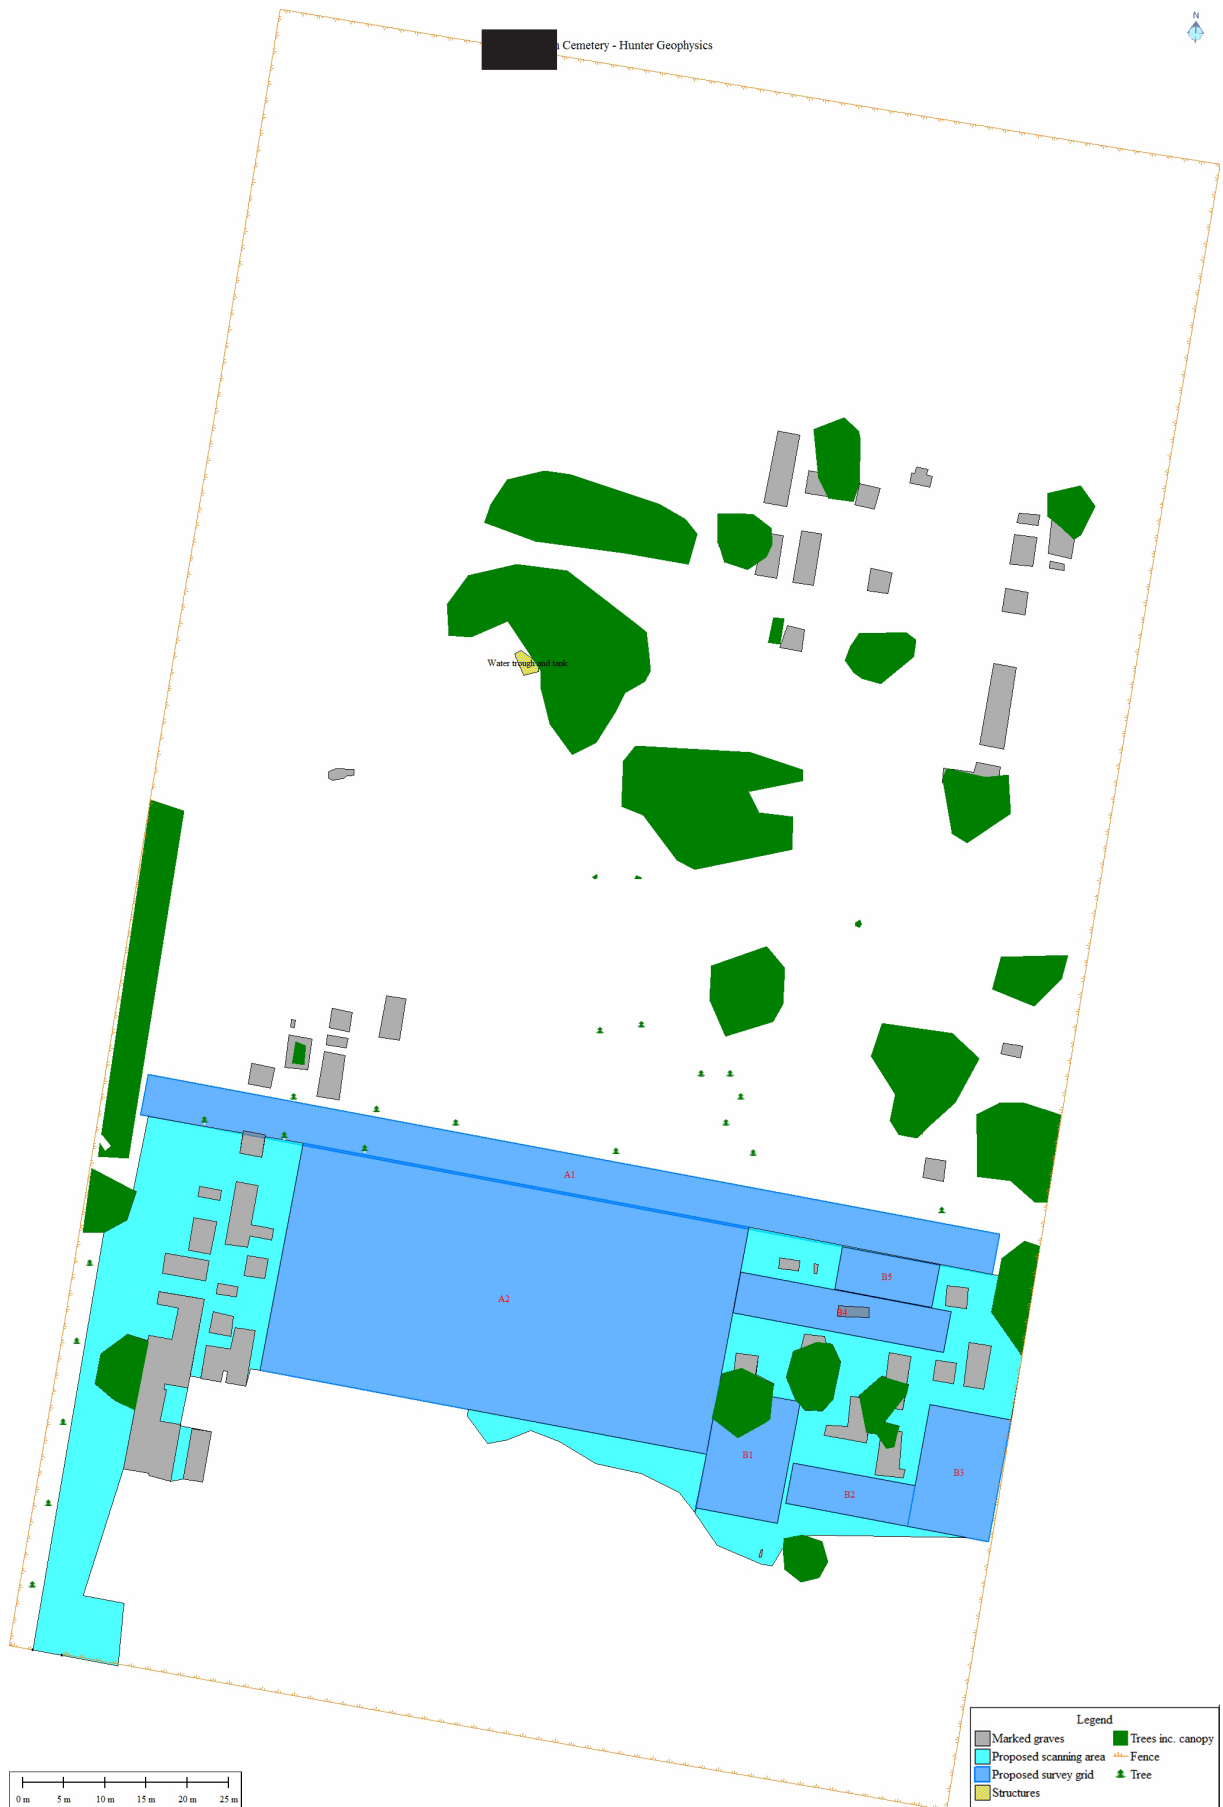

Figure 4: site map showing the location of all survey grids (in dark blue) and scanning areas (in light blue).

---

### Data processing

The ground-penetrating radar data were downloaded onto a computer and were arranged into separate folders based on the survey grid number.

Please refer to figure 4 on the previous page, or to the GIS data on the accompanying USB memory stick (refer to page 24), for a map showing where each survey grid was located.

The data were processed in the Geophysical Archaeometry Laboratory's GPR-SLICE software. Data processing routines were applied to the raw data in order to remove noise and enhance clarity. The processed radargram data were then sliced horizontally and plotted into XYZ tables.

Image maps ("depth slices") were created from the tables and were used to create a three-dimensional volume of the data, which was then interpreted, using the radargrams and depth slices as an aid. Interpretations were drawn onto the three-dimensional data volume in GPR-SLICE and then exported to DXF files, which were then imported into GIS for inclusion in the site map.

### Reporting, mapping and archiving

The geophysical survey and report follow the recommendations outlined in the English Heritage Guidelines (David 1995) and IFA Paper No. 6 (Gaffney et al. 2002) as a minimum standard. Mapping was performed using a Topcon GR-3 real-time kinematic global navigation satellite system (RTK GNSS), or a Leica TS-15 robotic total station, providing a precision of less than one centimetre in the horizontal plane, and less than two centimetres in the vertical plane. This is of a higher precision than that required by the English Heritage Guidelines and Aboriginal Affairs Victoria requirements (both of which require a half-metre precision as a minimum).

Geophysical data, figures and text are archived in-house following the recommendations of the Archaeology Data Service (Schmidt 2001). All data, figures and text are also provided to the client and are submitted to Heritage Victoria for archival.

## Results

### Ground-penetrating Radar survey

The ground-penetrating radar survey revealed the location of unmarked graves within the survey and scanning areas. A minimum of 132 unmarked graves have been located. Additionally, other areas of uncertain soil disturbance have been located; these areas are consistent with 'floating' boulders within the soil matrix, as well as the possible stacking of several unmarked graves on top of each other, perhaps in different orientations. Please note that these interpretations are subject to a level of uncertainty as explained on page 2. Several rectangular features (marked as 'high reflectivity area' and 'low reflectivity area' in the following maps) were also detected. The exact nature of these features is unknown. However, their dimensions are consistent with pre-established burial rows which were later buried. It is possible that the ground surface in these areas was built up in preparation for new burials, and was later levelled. Unmarked burials may or may not be present in these areas.

The following pages contain maps which show the location of all detected features. An accompanying memory stick contains digital maps and GIS mapping data. Please refer to page page 24 for details.

## Conclusion

### Satisfaction of objectives

The geophysical survey undertaken for this project has successfully located the unmarked graves present within the areas searched at the [redacted] Cemetery (as defined in figure 4 on page 8).

### Summary of results

The survey has located at least 132 areas of disturbed soil stratigraphy most likely to be associated with unmarked grave shafts and funerary urn burials and other areas of soil disturbance which may be indicative of unmarked graves or other buried features, including three possible burial rows which may or may not contain unmarked graves.

### Geophysical research value

[redacted]

### Dissemination

This report was submitted to the [redacted] Cemetery Trust in January 2015.

## Recommendations

Hunter Geophysics recommends the marking out of detected unmarked graves on the ground surface as such will make the results of this survey more readily accessible to those excavating new graves in future. Hunter Geophysics are capable of meeting this recommendation should the client so desire under a separate contract.

Based on earlier surveys by Hunter Geophysics at other cemeteries (refer to Hunter Geophysics report codes 2014/2, 2014/4 and 2014/8), and due to the detection of unmarked graves close to the western fence at the [redacted] Cemetery, it is recommended that areas outside the cemetery boundary - such as the paddock to the immediate west of the cemetery - be subjected to intensive geophysical surveys as well, in order to ensure those areas do not contain unmarked graves.

Given the detection of unmarked graves within the scanning areas, it is recommended that these areas are subjected to high-resolution surveying in order to precisely map their location.

Further expansion of the survey to the south and to the north (as per earlier discussions with the client) is also recommended.

## What's on the USB

A Universal Serial Bus v3 (USB) memory stick is included with this report. The following files may be found on the memory stick in digital form:

All figures included in this report.

The report itself in Adobe InDesign v8 format and also in Adobe Portable Document Format (PDF).

Site map file (with a .gmp file extension) for use with Global Mapper v15.1 or later.

All geophysical datasets in their own proprietary digital formats.

N.B.: A demonstration version of Global Mapper - which allows viewing of gmp files - is available from the Blue Marble Geographics website at <http://www.bluemarblegeo.com/products/global-mapper-download.php>.

Should GIS data be required in other formats, please contact Hunter Geophysics directly.
